Abstract

The purpose of this paper is to study the construction of complete and maximal (k, n) -arcs in the projective plane $PG(2, 7)$, $n = 2, 3, \dots, 8$.

A (k, n) -arc K in a projective plane is a set of K points such that no $n + 1$ of which are collinear. A (k, n) -arc is complete if it is not contained in a $(k + 1, n)$ -arc.

A (k, n) -arc is a maximal if and only if every line in $PG(2, P)$ is a O -secant, or n -secant, which represented as $(k, 2)$ -arc and $(k, 8)$ -arc.

Introduction

Ahmad(1999) [4] studied the complete arcs in the projective plane over Galois Field $GF(9)$, also Rashad (1999) [10] showed the complete arcs in the projective plane over Galois Field $GF(q)$ and Massa (2004) [8] studied the construction of (k, n) -arcs from (k, m) -arcs in the $PG(2, 17)$ for $2 \leq m < n$. Finally Najm (2005) [9] studied the construction of (k, n) -arcs from (k, m) -arcs in the $PG(2, 13)$ for $2 \leq m < n$. This paper deals with complete (k, n) -arc, maximal (k, n) -arc and how constructed from complete (k, m) -arc, $2 \leq m < n$.

The construction of complete (k, n) -arc, $n < k$ prepared from the union of some complete (k, m) -arc, $2 \leq m < n$. Usually the construction arc is incomplete arc and we get the complete by eliminating some points from the incomplete (k, n) -arc.

**CONSTRUCTION OF COMPLETE AND MAXIMAL (k, n)
ARCS IN THE PROJECTIVE PLANE $PG(2, 7)$**

By Najim Abdullah Ismaeel

The only two maximal arcs are $(k, 2)$ – arc and $(k, 8)$ – arc which represented the whole plane since each line contains eight points.

Basic Definition

Definition (K, n) – Arcs [1, 2, 6, 7] : A (k, n) – arc in the projective plane $PG(2, p)$ is a set K points such that some line meets K in n points but no line meets k in more than n points $n \geq 2$, p is prime

Definition [4, 6, 9, 10] : A (k, n) – arc is complete if it is not contained in 2.2
 $(k + 1, n)$ – arc.

Definition [3, 6, 8, 12] : A point p which is not on (k, n) – arc K has index i if there are exactly $i(n - \text{secant})$ through p , we denoted the numbers of point p of index i by C_i .

Definition [5, 6, 9, 11] : A (k, n) – arc K is a maximal if and only if every line in $PG(2, p)$ is a 0 – secant or n – secant.

2.5 Definition $PG(2, 7)$ [1, 6, 10] : A $PG(2, 7)$ is the two – dimensional projective space which consists of points and lines with incidence relation between them and satisfying the following axioms:

- i-* Any two distinct lines are intersected in a unique point.
- ii-* Any two distinct points are contained in a unique line.
- iii* – There exist at least four points such that no three of them are collinear .

Remark (1) [4, 5, 6] : A (k, n) – arc K is complete if and only if $C_0 = 0$, we mean that C_0 is $0(n - \text{secant})$, thus K is complete if and only if every point of $PG(2, p)$ lies on some $(n - \text{secant})$ of K

CONSTRUCTION OF COMPLETE AND MAXIMAL (k, n)
ARCS IN THE PROJECTIVE PLANE PG (2, 7)

By Najim Abdullah Ismaeel

The Projective Plane PG (2, 7)

The projective plane PG (2 , 7) contains 57 points and 57 lines , every line contains 8 points and every point is on 8 lines . Any line in PG (2 , 7) can be constructed by means of variety v. let P_i and L_i , $i = 1 , 2 , \dots, 57$ be the points and lines of PG(2 , 7) respectively. Let i stands for the points P_i and the lines L_i , then all the points and the lines in PG (2, 7) are given in the table (1)

i	P_i	L_i							
1	(1, 0, 0)	2	9	16	23	30	37	44	51
2	(0, 1, 0)	1	9	10	11	12	13	14	15

57	(6, 6, 1)	8	10	16	29	35	41	47	53

Table (1)

(Contains 57 points and 57 lines, every line contains 8 points and every point is on 8 lines)

4- The Construction of (k, n) – Arcs in PG (2, 7) :

Let $A = \{ 1,2,9,17 \}$ be the set reference and unit points in the table (1) such that $1 = (1, 0, 0)$, $2 = (0, 1, 0)$, $9 = (0, 0, 1)$, $17 = (1, 1, 1)$. A is a $(4, 2)$ – arc, since no three points of A are collinear, the points of A are the vertices of a quadrangle whose side are the lines

- $l_1 = [1,2] = \{ 1,2,3,4,5,6,7,8 \}$
- $l_2 = [1,9] = \{ 1,9,10,11,12,13,14,15 \}$
- $l_3 = [1,17] = \{ 1,16,17,18,19,20,21,22 \}$
- $l_4 = [2,9] = \{ 2,9,16,23,30,37,44,51 \}$
- $l_5 = [2,17] = \{ 2,10,17,24,31,38,45,52 \}$
- $l_6 = [9,17] = \{ 3,9,17,25,33,41,49,57 \}$

The diagonal points of A are the points $\{ 3, 10, 16 \}$ where:

$3 = l_1 \cap l_2$

$10 = l_2 \cap l_5$

$16 = l_3 \cap l_4$

which are the intersection points of pairs of the opposite sides. Then

there are 37 points on the sides of the quadrangle, four of them are points of the arc A , and

**CONSTRUCTION OF COMPLETE AND MAXIMAL (k, n)
ARCS IN THE PROJECTIVE PLANE PG (2, 7)
By Najim Abdullah Ismaeel**

three of them are diagonal points of A , so there are 20 points not on the sides of the quadrangle which are the points of index zero for A these points are: {24,27,28,29,32,34,35,36,39,40,42,43,46,47,48,50,53,54,55,56 }

Hence A is incomplete (4, 2) – arc

**The Conics In PG (2, 7) Through the Reference
and Unit points The general equation of conic is**

$$a_1 x_1^2 + a_2 x_2^2 + a_3 x_3^2 + a_4 x_1 x_2 + a_5 x_1 x_3 + a_6 x_2 x_3 = 0 \quad \dots\dots (1)$$

By substituting the points of the arc – A in (1) , we get

$$1 = (1, 0, 0) \rightarrow a_1 = 0$$

$$2 = (0, 1, 0) \rightarrow a_2 = 0$$

$$9 = (0, 0, 1) \rightarrow a_3 = 0$$

$$17 = (1, 1, 1) \rightarrow a_4 + a_5 + a_6 = 0$$

So equation (1) becomes

$$a_4 x_1 x_2 + a_5 x_1 x_3 + a_6 x_2 x_3 = 0 \quad \dots\dots (2)$$

If $a_4 = 0$, then $a_5 x_1 x_3 + a_6 x_2 x_3 = 0$

Hence $x_3 (a_5 x_1 + a_6 x_2) = 0$, $x_3 = 0$ or $a_5 x_1 + a_6 x_2 = 0$

Which are a pair of lines, then the conic is degenerated, therefore $a_4 \neq 0$

Similarly $a_5 \neq 0$ and $a_6 \neq 0$

Dividing equation (2) by a_4 we get

$$x_1 x_2 + \frac{a_5}{a_4} x_1 x_3 + \frac{a_6}{a_4} x_2 x_3 = 0$$

$$x_1 x_2 + \alpha x_1 x_3 + \beta x_2 x_3 = 0 \quad \dots\dots(3)$$

$$\alpha = \frac{a_5}{a_4} , \quad \beta = \frac{a_6}{a_4} , \quad \text{then}$$

$$1 + \alpha + \beta = 0 \pmod{7}$$

**CONSTRUCTION OF COMPLETE AND MAXIMAL (k, n)
ARCS IN THE PROJECTIVE PLANE PG (2, 7)**

By Najim Abdullah Ismaeel

$\beta = -(1 + \alpha) + ZK$, then (3) can be written as:

$$x_1 x_2 + \alpha x_1 x_3 - (1 + \alpha) x_2 x_3 = 0 \quad \dots\dots(4)$$

Where $\alpha \neq 0$ and $\alpha \neq 6$, for if $\alpha = 0$ or $\alpha = 6$, we get degenerated conic, i.e $\alpha = 1, 2, 3, 4, 5$

**The Equations and the Points of the Conic of
PG (2, 7) Through The Reference and Unit Points**

For any value for α there is a unique conic containing eight points, four of them are the reference and unit points

1- If $\alpha = 1$, then the equation of the conic C_1 is

$$x_1 x_2 + x_1 x_3 + 5 x_2 x_3 = 0, \text{ the point of } C_1 \text{ are } \{1, 2, 9, 17, 29, 35, 40, 48, \}$$

which is a complete $(7, 2)$ – arc, since there are no points of index zero for C_1

2- If $\alpha = 2$, then the equation of the conic C_2 is

$$x_1 x_2 + 2 x_1 x_3 + 4 x_2 x_3 = 0$$

The points of C_2 are $\{1, 2, 9, 17, 28, 36, 39, 55\}$, which is a complete $(7, 2)$ – arc, since there are no points of index zero for C_2

3- If $\alpha = 3$, then the equation of the conic C_3 is

$$x_1 x_2 + 3x_1 x_3 + 3x_2 x_3 = 0$$

The points of C_3 are $\{1, 2, 9, 17, 26, 32, 50, 56\}$, which is a complete $(7, 2)$ – arc, since there are no points of index zero for C_3

4- If $\alpha = 4$, then the equation of the conic C_4 is

$$x_1 x_2 + 4x_1 x_3 + 2 x_2 x_3 = 0$$

The points of C_4 are $\{1, 2, 9, 17, 27, 43, 46, 54\}$, which is a complete $(7, 2)$ – arc since there are no points of index zero for C_4

5- If $\alpha = 5$, then the equation of the conic C_5 is

$$x_1 x_2 + 5 x_1 x_3 + x_2 x_3 = 0$$

The points of C_5 are $\{1, 2, 9, 17, 34, 42, 47, 53\}$, which is complete $(7, 2)$ – arc, since there are no points of index zero for C_5

**CONSTRUCTION OF COMPLETE AND MAXIMAL (k, n)
ARCS IN THE PROJECTIVE PLANE $PG(2, 7)$**

By Najim Abdullah Ismaeel

Thus there are five complete $(7, 2)$ – arcs in the $PG(2, 7)$ which are

$$C_1 = \{1, 2, 9, 17, 29, 35, 40, 48\}$$

$$C_2 = \{1, 2, 9, 17, 28, 36, 39, 55\}$$

$$C_3 = \{1, 2, 9, 17, 26, 32, 50, 56\}$$

$$C_4 = \{1, 2, 9, 17, 27, 43, 46, 54\}$$

$$C_5 = \{1, 2, 9, 17, 34, 42, 47, 53\}$$

Construction of Complete $(k, 3)$ – Arcs

We get complete $(k, 3)$ – arcs through the following steps:

We take the union of two complete $(8, 2)$ – arcs, say C_1 and C_2 denoted by D_1 .

a . Let $D_1 = C_1 \cup C_2 = \{1, 2, 9, 17, 28, 29, 35, 36, 39, 40, 48, 55\}$, we notice that D_1 is incomplete $(k, 3)$ – arc, since there exist the points $\{3, 5, 16, 18, 45, 47, 51, 53\}$ of index zero for D_1

B – We add the point $\{3\}$ from the index zero to D_1 , therefore

$D_1^1 = \{1, 2, 3, 9, 17, 28, 29, 35, 36, 39, 40, 48, 55\}$ is a complete $(13, 3)$ – arc, since there is no point of index zero i.e $C_0 = 0$.

Let $D_2 = C_1 \cup C_3 = \{1, 2, 9, 17, 26, 29, 32, 35, 40, 48, 55\}$, we notice that there are some line meet D_2 in four points, hence $(k, 3)$ is not complete. So we eliminate some points from D_2 to determine a complete $(k, 3)$ – arc as follows:

Let $D_2^1 = C_1 \cup C_3 / \{48\} = \{1, 2, 9, 17, 26, 29, 32, 35, 40, 50, 56\}$, we notice that D_2 is incomplete

$(k, 3)$ – arc, since there exist the points of index zero for D_2 which are

$$\{8, 10, 11, 13, 18, 38, 41, 51, 52\}$$

We add $\{8, 11\}$ from the index zero to D_2 , therefore

$D_2 = \{1, 2, 8, 9, 11, 17, 26, 29, 32, 35, 40, 50, 56\}$ is a complete $(13, 3)$ – arc, since $C_0 = 0$

Let $D_3 = C_1 \cup C_4 = \{1, 2, 9, 17, 27, 29, 35, 40, 43, 46, 48, 54\}$, notice that D_3 is incomplete

$(k, 3)$ – arc, since there exist points of index zero for D_3 which are $\{10, 16, 18, 32, 51, 56\}$

we add $\{56\}$ from the index zero to D_3 , therefore

**CONSTRUCTION OF COMPLETE AND MAXIMAL (k, n)
ARCS IN THE PROJECTIVE PLANE PG (2, 7)**

By Najim Abdullah Ismaeel

$D_3^1 = \{1, 2, 9, 17, 27, 29, 35, 40, 43, 46, 48, 54, 56\}$ is a complete $(13, 3)$ -arc, since $C_0 = 0$

Let $D_4 = C_1 \cup C_5 = \{1, 2, 9, 17, 29, 34, 35, 40, 42, 47, 48, 53\}$, notice that there are some line meet D_4 in four point, hence $(k, 3)$ is not complete. So we eliminate some points from D_4 to determine a complete $(k, 3)$ -arc as follows

Let $D_4 = C_1 \cup C_5 / \{53\} = \{1, 2, 9, 17, 29, 34, 35, 40, 42, 47, 48\}$, we notice that D_4 is incomplete $(k, 3)$ -arc since there exist points of index zero for D_4 which are $\{3, 4, 15, 18, 24, 25, 51, 57\}$

We add $\{4, 25\}$ from the index zero to D_4 , therefore

$D_4^1 = \{1, 2, 4, 9, 17, 25, 29, 34, 35, 40, 42, 47, 48\}$ is a complete $(13, 3)$ -arc since $C_0 = 0$.

Construction of Complete (k, 4) – Arcs

Let $E_1 = D_1 \cup D_2 = \{1, 2, 3, 8, 9, 11, 17, 26, 28, 29, 32, 35, 36, 39, 40, 48, 50, 56\}$, we notice that there are some line meet E_1 in five points, and hence E_1 is not complete $(k, 4)$ -arc there for we eliminate $\{32, 48\}$ from it to determine complete $(k, 4)$ -arc as follows,

$E_1 = D_1^1 \cup D_2^1 / \{32, 48\} = \{1, 2, 3, 8, 9, 11, 17, 26, 28, 29, 35, 36, 39, 40, 50, 56\}$, E_1 is incomplete since there are points of index zero which are $\{5, 10, 13, 18, 19, 30, 33, 41, 45, 47, 51, 53\}$.

We add $\{5, 10, 31\}$ from the index zero to E_1 , therefore

$E_1^1 = \{1, 2, 3, 5, 8, 9, 10, 11, 17, 26, 28, 29, 31, 35, 36, 39, 40, 50, 56\}$, is a complete $(19, 4)$ -arc, since $C_0 = 0$.

Let $E_2 = D_1^1 \cup D_3^1 = \{1, 2, 3, 9, 17, 27, 28, 29, 35, 36, 39, 40, 43, 46, 48, 54, 55, 56\}$, notice that E_2 is not complete $(k, 4)$ -arc, since there are points of index zero which are $\{5, 10, 31, 33, 45\}$

We add $\{5, 31\}$ from index zero to E_2 , therefore

$E_2^1 = \{1, 2, 3, 5, 9, 17, 27, 29, 31, 35, 36, 39, 40, 43, 46, 48, 54, 55, 56\}$ is a complete $(19 - 4)$ -arc, since there is no point of index zero.

Let $E_3 = D_1^1 \cup D_4^1 = \{1, 2, 3, 4, 9, 17, 25, 28, 29, 34, 35, 36, 39, 40, 42, 47, 48, 55\}$. Notice that E_3 is not complete $(k, 4)$ -arc, since there are points of index zero which are $\{16, 50, 51, 53\}$

CONSTRUCTION OF COMPLETE AND MAXIMAL (k, n)
ARCS IN THE PROJECTIVE PLANE $PG(2, 7)$

By Najim Abdullah Ismaeel

We add $\{16, 50\}$ from index zero to E_3 , therefore
 $E_3^1 = \{1, 2, 3, 4, 9, 16, 17, 25, 28, 29, 34, 35, 36, 39, 40, 42, 47, 48, 50, 55\}$ is complete
 $(20, 4)$ – arc, since there is no points of index zero.

Construction of Complete $(k, 5)$ – Arcs

Let $F_1 = E_1^1 \cup E_2^1 = \{1, 2, 3, 5, 8, 9, 10, 11, 17, 26, 27, 28, 29, 31, 35, 36, 39, 40, 43, 46, 48, 50, 54, 55, 56\}$, notice that there is a line meet F_1 in six points, hence $(k, 5)$ is not complete. So we eliminate a point $\{11\}$ from F_1 to determine a complete $(k, 5)$ – arc as follows

Let $F_1 = E_1 \cup E_2 / \{11\} = \{1, 2, 3, 5, 8, 9, 10, 17, 26, 27, 28, 29, 31, 35, 36, 39, 40, 43, 46, 48, 50, 54, 55, 56\}$. Notice that F_1 is incomplete since there exist points of index zero which are $\{12, 13, 16, 18, 19, 32, 38, 41, 44, 45, 47, 49, 51\}$

We add $\{12, 13, 18, 32\}$ from index zero to F_1 , then
 $F_1^1 = \{1, 2, 3, 5, 8, 9, 10, 12, 13, 17, 18, 26, 27, 28, 29, 31, 32, 35, 36, 39, 40, 43, 46, 48, 50, 54, 55, 56\}$ is a complete $(28, 5)$ – arc, since $C_0 = 0$

Let $F_2 = E_1 \cup E_3 = \{1, 2, 3, 4, 5, 8, 9, 10, 11, 16, 17, 25, 26, 28, 29, 31, 34, 35, 36, 39, 40, 42, 47, 48, 50, 55, 56\}$
 Notice that there are some lines meet F_2 in six points, hence $(k, 5)$ is un complete. So we eliminate some points from F_2 to determine a complete $(k, 5)$ – arc as follows

Let $F_2 = E_1^1 \cup E_3^1 / \{3, 16, 17\} = \{1, 2, 4, 5, 8, 9, 10, 11, 25, 26, 28, 29, 31, 34, 35, 36, 39, 40, 42, 47, 48, 50, 55, 56\}$, we notice that F_2 is incomplete, since there exist the points of index zero which are $\{12, 15, 43\}$

We add $\{15\}$ from index zero to F_2 , then
 $F_2^1 = \{1, 2, 4, 5, 8, 9, 10, 11, 15, 25, 26, 28, 29, 31, 34, 35, 36, 39, 40, 42, 47, 48, 50, 55, 56\}$ is a complete $(25, 5)$ – arc, since $C_0 = 0$.

Construction of Complete $(k, 6)$ – Arcs

Let $G = F_1^1 \cup F_2^1 = \{1, 2, 3, 4, 5, 8, 9, 10, 11, 12, 13, 15, 17, 18, 25, 26, 27, 28, 29, 31, 32, 34, 35, 36, 39, 40, 42, 43, 46, 47, 48, 50, 5\}$

**CONSTRUCTION OF COMPLETE AND MAXIMAL (k, n)
ARCS IN THE PROJECTIVE PLANE $PG(2, 7)$**

By Najim Abdullah Ismaeel

$4,55,56$ } , notice that there are some lines meet G in seven points ,hence $(k, 6) -$ arc is incomplete arc. So we eliminate some points from G to determine a complete $(k, 5) -$ arc as follows.

Let $G = F_1^1 \cup F_2^1 / \{9, 39, 42\} =$
 $\{1,2,3,4,5,8,10,11,12,13,15,17,18,25,26,27,28,29,31,32,34,35,36,40,43,46,47,48,50,54,55,56$
 $\}$.

Notice that G is incomplete, since there exist the points of index zero for G which are

$\{21,45,49,52\}$. We add $\{21,49\}$ from index zero to G , therefore

$G^1 = \{1,2,3,4,5,8,10,11,12,13,15,17,18,21,25,26,27,28,29,31,32,34,35,36,40,43,46,47,48,49,50$
 $,54,55,56\}$ is a complete $(34, 6) -$ arc , since $C_0 = 0$.

Construction of Complete $(k, 7) -$ Arcs

Let us take complete $(k, 6) -$ arc G^1 , G^1 is incomplete $(k, 7) -$ arc , since there exist points of index zero for G^1 which are

$\{6,7,9,14,16,19,20,22,23,24,30,33,37,38,39,41,42,44,45,51,52,53,57\}$

We add eight points of index zero which are $\{9,16,20,33,39,42,44,57\}$ to G^1 ,we denoted it by H

$H = \{1,2,3,4,5,8,9,10,11,12,13,15,16,17,18,20,21,25,26,27,28,29,31,32,33,34,35,36,39,40,42,43,44,46,47,48,49,50,54,55,56,57\}$ is a complete $(42, 7) -$ arc , since $C_0 = 0$.

Construction of Complete $(k, 8) -$ Arcs

We take complete $(2, 7) -$ arc H , H is incomplete $(k, 8) -$ arc since there exist points of index zero for H which are $\{6,7,14,19,22,23,24,30,37,38,41,45,51,52,53\}$

We add the points of index zero to H denoted by I , then I contains all the points of the plane i.e $I = \{1,2,3,\dots,55,56,57\}$ is a complete $(57, 8) -$ arc.

This arc is the whole plane, since each line in it contains eight points. Hence this arc is a maximal arc.

CONSTRUCTION OF COMPLETE AND MAXIMAL (k, n)
ARCS IN THE PROJECTIVE PLANE $PG(2, 7)$

By Najim Abdullah Ismaeel

بناء أقواس كاملة وأعظمية - (k, n) في المستوى الإسقاطي $PG(2, 7)$

الخلاصة

الغرض من هذا البحث هو دراسة بناء أقواس كاملة وأعظمية - (k, n) $n = 1, 2, \dots, 8$ في المستوى الإسقاطي $PG(2, 7)$.
قوس - (k, n) في المستوى الإسقاطي هو مجموعة من k من النقاط بحيث لا يوجد $n + 1$ نقطة منها على استقامة واحدة. قوس - (k, n) يكون كاملاً إذا لم يكن محتوي في القوس - $(k + 1, n)$. قوس - (k, n) يكون أعظم قوس إذا فقط إذا كان كل مستقيم في $PG(2, p)$ لا يقطع القوس أو يقطعه في n من النقاط، وهي هنا تمثل القوسين $(k, 2)$ و $(k, 8)$.
