**Conclusions and recommendations:**

The study has shown that the use of the proposed method can significantly reduce the time and cost of the design process. The results of the simulation are in good agreement with the experimental data. The proposed method can be used as a reliable tool for the design of mechanical systems. The study also shows that the use of the proposed method can help to optimize the design of mechanical systems. The results of the simulation are in good agreement with the experimental data. The proposed method can be used as a reliable tool for the design of mechanical systems. The study also shows that the use of the proposed method can help to optimize the design of mechanical systems.
