Isolation and Identification of Bacterial Causes of Urinary Tract Infections and their Relation to Physical and Chemical Characters of Urine in Human and Sheep in Diyala Province

A Thesis

Submitted to the Council of the College of Veterinary Medicine,
University of Diyala, in Partial Fulfillment of the Requirements
for the Degree of Master of Science in Internal and Preventive
Veterinary Medicine - Zoonosis

By

Mohammed Jasim Mohammed Al-Obaidi

Supervised by

Assist Prof. Dr. Khalid Mahmood Hammadi

2021 A. D.

1443 A.H.

Supervisor Certification

We certify that the thesis entitled **(Isolation and Identification of Bacterial causes of Urinary Tract Infections and Their Relation to Physical and Chemical Characters of Urine in Human and Sheep in Diyala Province)** has been prepared under my supervision at the Department of Medicine, College of Veterinary Medicine, University of Diyala, as partial fulfillment of the requirements for the Degree of Master of Science in Internal and Preventive Medicine- Zoonosis.

Supervisor

Assist Prof. Dr. Khalid Mahmoud Hammadi

Collage of Education
Al-Iraqia University
2021

In view of the available recommendation, I forward this thesis for debate
by the examining committee

Assist. Prof. Dr. Khalid Ibrahim Abd

Vice Dean of post graduate studies and science affairs

College of Veterinary Medicine

University of Diyala

2021

Examination Committee Certification

We, the examining committee, certify that after reading this thesis entitled (**Isolation and Identification of Bacterial causes of Urinary Tract Infections and Their Relation to Physical and Chemical Characters of Urine in Human and Sheep in Diyala Province**) was prepared by Mohammed Jasim Mohammed Alobaidi in its contents, we think it is adequate for the award degree of Master of Science in Internal and Preventive Medicine - Zoonosis.

Dedication

To the owner of the first and last credit, the guide to the right path... Allah Almighty

To whom my eyes rejoice with his visions, and my heart rejoices with his secrets (Sheikh Dr. Mahmoud Sheikh Younis Al-Tai)

To those who raised me on the love of science when I was young, and God fulfilled their dream when I was old...

(My dear parents)

To those who calm me down by meeting them, and the gaps smile at their faces... (My wife and children)

To those who are for my heart my joy and for my life the best of people (brothers and sisters)

To the sincere hands that helped me... My dear professors

To everyone who spared effort to help me

Dedicate this message

Mohammed

Acknowledgment

Firstly, thanks to ((**ALLAH**)), the most gracious, the most merciful, for helping me to finish my study.

I am heartily thankful to my supervisor Assist **Prof. Dr. Khalid Mahmood Hammadi** for all of his time, advice, and guidance throughout my study.

I would like to thank the Deanery of the College of the Veterinary Medicine/University of Diyala, represented by **Prof. Dr. Talib Jawad Kadhim** for their outstanding help and support.

I would like to express my appreciation to **Dr. Basim Mohammed Mansoor** for his help in many areas of the project.

Great thanks also extended to the staff members in Laboratories of College of Veterinary Medicine, the University of Diyala, especially, **Dr.Oras Salman , Dr.Ayat Jasim , Dr.Hiba ,Dr. Zena** for their support and staff members in Laboratories of Baqubah Teaching Hospital to help me complete this study .

Special thanks goes to my best friend, **Dr. Akram Ahmed, Dr. Rofeida Mohammed and Dr. Jassim Hadi** , for their encouragement and help.

Finally, I would like to thank everyone who helped me and I apologies to those whom I forgot to mention.

Summary

The current study was conducted to evaluate the specific value of physical and chemical characteristics in addition to the microscopical examination of urine sediment and study the common bacteria in urine of human and sheep. Therefore 300 urine samples were collected (150 for each human and sheep) (75 male and 75 female) from the urinary bladder of sheep and from midstream of human urine, from June, 2019 – May, 2020. The result of physical and chemical examination of urine samples in both human and sheep (Bacterial non infected), reported no change in the physical and chemical value . While in urine samples (human and sheep) from which the bacteria were infected showed changes in all physical parameters value (colour, transparency, foam, specific gravity) of urine, So the chemical examination of the samples (human and sheep both male and female) appear an increase in PH of urine while the examination of protein showed positive results. Also, revealed positive result for blood examination. On the other hand, all the samples showed positive result for ketone bodies examination. The results of examination of urine sediment revealed high number of the epithelial cells, pus cell, red blood cells (RBCs) and Cast in addition to Bacteria. The result of urine sample culture, in human the total isolated bacteria were 80 (53.3%) in which (35) isolates from males (45) isolates from females with different species of bacteria which included (12) *Escherichia coli*, (3)*Staphylococcus Haemolyticus*, (4) for each of these bacteria: *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, *Proteus mirabilis* and *Staphylococcus aureus*, one isolated for each of the next bacteria: *Pantoniae spp* , *Sphingomonas paucimobilis* , *Gamella bergeri* , *Staphylococcus Kloosii* .

In female there were (19) *E. coli*, (3) for *Pseudomonas aeruginosa* and *Proteus mirabilis* , (5) *Staphylococcus Haemolyticus*, and (6) *Klebsiella*

pneumoniae, (2) *Staphylococcus aureus*, (1) for each of the these bacteria: *Streptococcus agalactiae* , *Acinetobacter Baumannii complex* , *Kocuria Kiristinae* , *Staphylococcus sciuri* , *Vibrio Fluvialis* , *Enterococcus faecalis* , *Serratia marcescens* .

Generally, the bacterial isolation in human were at the following percentage for each bacteria, *Escherichia coli* (38.7%) , (12.5 %) *Klebsiella pneumoniae*, (8%) *Staphylococcus Haemolyticus* and for each of *Pseudomonas aeruginosa*, *Proteus mirabilis* were (8.7%).

While from sheep samples 90 (60%), isolated positive (42 for male and 48 for female) for bacterial isolation, in male were(29) *E. coli*, (6) *Staphylococcus aureus*, (3) for *Proteus mirabilis* , (2) for each of *Klebsiella pneumoniae* and *Pseudomonas aeruginosa*, and, while in female, (34) *Escherichia coli*, (4) for each of *Klebsiella pneumoniae* and *Staphylococcus aureus*, (3) for each of *Pseudomonas aeruginosa* and *Proteus mirabilis*. Generally, the bacterial isolation in sheep were at the following percentage for each bacteria, (70%) for *Escherichia coli* , (11.1 %) *Staphylococcus aureus* , (6.6 %) for each of *Klebsiella pneumoniae* and *Proteus mirabilis* and (5.5%) for *Pseudomonas aeruginosa*. It is clear that *E. coli* bacteria were the most common zoonotic bacteria in both human and sheep urine samples. The sensitivity test results showed that all isolates were resistant to Clindamycin, Cloxacillin and Piperacillin. While to Cefixime, all isolates were resisted, except *Klebsiella pneumoniae*. But to Amoxicillin and Metropene, all were resistant, except *Pseudomonas aeruginosa*, while Vancomycin only *Staphylococcus* was sensitive, Metronidazole all isolated resistant except *Pseudomonas aeruginosa* were sensitive. In the end, this study is the first study in Diyala province that investigated important bacteria in both human and sheep urine.

Chapter one

Introduction

=====

1.1. Introduction

Urinary Tract Infection (UTI) is one of the most common bacterial infections encountered by clinicians in developing countries .there is a compromise of host defense mechanisms and a virulent microbe adheres, multiplies, and persists in a portion of the urinary tract. Host defenses include normal micturition, anatomic structures, the mucosal barrier, properties of urine, and systemic immunocompetence (Chew *et al* ,. 2020)

Most commonly UTIs are caused by bacteria, but fungi and viruses also may infect the urinary tract.. Most bacterial UTI occur as a consequence of ascending migration of pathogens through the genital tract and urethra to the bladder, ureters, and one or both kidneys. Rectal, perineal, and genital bacteria serve as the principal reservoirs for infection(Olin and Bartges , 2015) .

Urinary tract infections (UTIs) are among the most common infectious diseases worldwide but are significantly understudied. Uropathogenic *Escherichia coli* (*E-coli*) (UPEC) accounts for a significant proportion of UTI, but a large number of other species can infect the urinary tract, each of which will have unique host-pathogen interactions with the bladder environment. Given the substantial economic burden of UTI and its increasing antibiotic resistance (Murray *et al.*,2021).

Although UTI may leads to complications, it can cause significant morbidity and mortality particularly when recurrent (Abou Heidar *et al.*,

=====

2019). It is estimated that 150 million cases of UTI occur on a global basis per year resulting in more than 6 billion dollars in direct health care expenditure (Guy's and Thomas, 2004). Infections of the urinary tract are the second most common type of infection in humans. The variation of illnesses are quite wide ranging from asymptomatic bacteriuria to symptomatic urinary tract infections that spread to the blood causing complications such as shock and even death (Kline and Lewis, 2016).

Urinalysis is a remarkable tool that can reveal many of diseases that could go unnoticed and undiagnosed because they generally do not produce striking signs or symptoms. For examples include diabetes mellitus, various forms of glomerulonephritis, and chronic urinary tract infections. Observing the colour, transparency, microscopic , and chemical characteristics of urine and urinary sediments coupled with microbial culture and sensitivity test is likely to identify majority of the lower urinary tract disorders in domestic animals (Parrah *et al.*,2013).

Urinalysis though being a readily available and an inexpensive tool for the diagnosis and management of numerous urinary tract abnormalities, it is still a much neglected facet in veterinary medicine (Feather *et.al.* 2020).

=====

1.2. Aims of the Study

- 1- Study the physical and chemical parameters of urine from human and sheep.
- 2- Isolation and identification of most important zoonotic bacteria in urine of human and sheep.
- 3- Study the correlation between physical and chemical parameters with bacterial isolation .
- 4- Study of sensitivity tests of antibiotic to isolated bacteria.
